

Short Summary of Insight

The Retail Sales and Profit Analysis project involved cleaning, analysing, and visualizing retail business data to identify key performance trends. After performing data cleaning and validation, business metrics such as total sales, total profit, total orders, average discount, and shipping cost were analysed.

The dashboard provided insights into sales performance across different regions, product categories, customer segments, and products. Regional analysis helped identify the areas contributing the highest revenue, while product category analysis highlighted the most profitable categories. The Top Products by Sales chart revealed the products generating the highest revenue for the business.

Customer segment analysis showed which customer groups contributed the most profit, enabling better targeting and marketing strategies. The monthly sales trend analysis provided an overview of sales performance over time and helped identify seasonal patterns and business growth opportunities.

Overall, the project demonstrated how data cleaning, analysis, and visualization can be used to transform raw business data into actionable insights that support better decision-making and business growth.
